Greetings Uber Operations Team,

In Germany, every UberX ride is served by a licensed fleet partner whose car must return to its base after each trip. That makes one question an everyday operational lever: how many vehicles does a partner need, where, and at what hour? It is one of the questions my Master's thesis at TUM works on, and it is why I am applying for the 2027 Operations Internship in Berlin.

My thesis evaluated the impacts of fleet sizing across carsharing, ride-hailing and ride-pooling. I am extending FleetPy codebase, the open-source fleet simulation framework developed at TUM, to model carsharing, and testing it on empirical demand data to weigh what each extra vehicle costs against the service it adds. Before that, I modelled car-sharing demand and accessibility across Munich, and built machine-learning models that predict traffic flow. This background lets me treat marketplace questions where supply falls short, what a pricing or incentive change will do and I have the edge of simulating it first, then test against real data.

A model only matters once it reaches the people running operations, and building that bridge has been my job. For two years at Wipro, I built the ETL pipelines and Business Objects reports that operations teams at Transport for NSW used to track KPIs across a network of more than 629 million trips a year, as ridership grew 20% after the pandemic. I also built enterprise data warehousing for AusNet Services, a major Australian utility. Most recently, as Procurement & Outbound Logistics intern at BMW, I built Power BI frameworks that informed sourcing decisions and negotiation strategies. I also owned process improvements from idea to rollout, automating team workflows with Power Automate.

That combination is what I would bring to Uber's Mobility operations. I can model a supply problem, turn it into KPIs that stakeholders trust, and carry the fix through to execution. I would be glad to work on matching driver supply to demand by hour and area, helping fleet partners plan their fleets, or designing and evaluating marketplace experiments. I have worked with teams in India, Australia and Germany, often remotely, translating between technical and business people. I am absolutely in love with the idea of working with Uber, and at this point of time, with hands on emerging technologies, I being a very fresh and challenging perspectives of transport modelling also into the operational side of our business.

I can start on 1 February 2027 and work full time for six months, stay enrolled at TUM throughout, and would be ready to join full time once the internship ends. Thank you for considering my application. I would welcome the chance to discuss how I can contribute to Uber's operations in Berlin.

Kind regards,

Sai Avinash Thota
